

Where the camera enters the existing hand pipeline

$t_z = 2f/(sB)$ - the depth the hand is placed at is proportional to the focal length used

pipeline focal convention: $f = 5,000$ px

dataset-provided reference focal (median): $f \approx 923$ px

left: a training-convention virtual focal, $FOCAL_LENGTH/IMAGE_SIZE \times \max(W,H)$, never read from any calibration.

right: the dataset-provided camera intrinsic f_x , verified to be in the same original full-image pixel convention.
